Comparison with Lorenzen Table 7.2 — provisional geometry

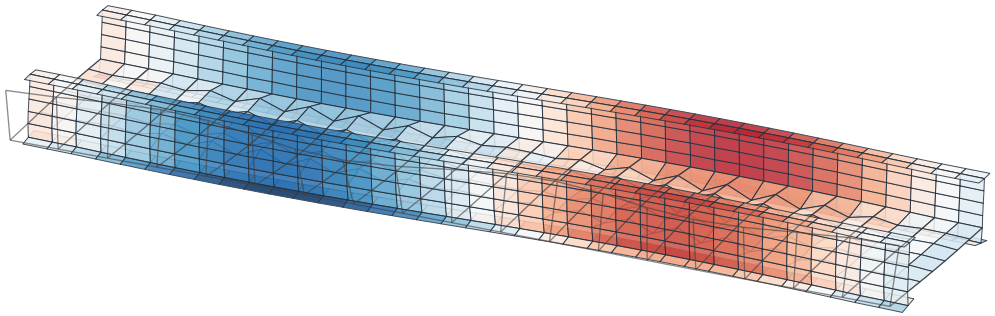

(a) First bending; candidate
FE 5.21 Hz | measured 6.73 Hz

(b) First torsion; candidate
FE 7.74 Hz | measured 8.99 Hz

(c) Second bending; mesh-sensitive candidate
FE 23.72 Hz | measured 16.14 Hz

(d) Thesis mode 4: second torsion
Measured frequency 18.68 Hz

No reliable family assignment
in the provisional reconstruction.

(e) Thesis mode 5: undefined
Measured frequency 24.13 Hz

Undefined in the thesis (MPC = 0.54).
No FE mode forced to match this frequency.

Assessment

First two shapes are stable under mesh refinement.
Higher-mode mapping is unresolved.

No train passage or target response was fitted.
This model has not passed physical validation.
